

Carolina, with additional drawings of the same. Referred to the Committee on the previous portions of the paper.

Professor Hare made some observations on the combustion of gum in oxygen gas, and stated that the brilliant light which it emitted during combustion, proceeded from the presence of lime, which he considered an essential constituent of gums.

Dr. Leidy stated that whilst engaged in examining the structure of some Lichens, he discovered numerous octagonal crystals intermingled with the cellular structure of several species of *Parmelia*. Many of the crystals equalled in size the greenish cells themselves, although none of them appeared to be contained within the latter. As chemical analysis has detected in these plants a large proportion of oxalate of lime, Dr. Leidy supposed these crystals to be that salt.
